

9. (Amended) The immunochromatographic specimen defined in Claim 1 wherein the marker includes at least one which is selected from a metal sol, an oxidized metal particle, a non-metal sol, a dye sol, a colored particle, a pigment, or an enzyme.

10. (Amended) The immunochromatographic specimen defined in Claim 1 wherein the analyte contains at least one of plasma protein, bacteria, and virus.

13. (Amended) The chromatograph analyzing method defined in Claim 11 wherein, in the case where the sample is blood, a signal from the marker in a coloration region is measured at a wavelength of any 580 nm or above, thereby qualitatively or quantitatively analyzing the analyte.

14. (Amended) The chromatograph analyzing method defined in Claim 11 wherein the immunochromatographic specimen includes a region where a substance which destroys cell components in the sample is held.

18. (Amended) The chromatograph analyzing method defined in Claim 11 wherein a coloration degree is qualitatively or quantitatively analyzed with a spectrophotometer.

19. (Amended) The chromatograph analyzing method defined in Claim 11 wherein the marker includes at least one which is selected from a metal sol, an oxidized metal particle, a non-metal sol, a dye sol, a colored particle, a pigment, or an enzyme.

20. (Amended) The chromatograph analyzing method defined in Claim 11 wherein the analyte contains at least one of plasma protein, bacteria, and virus.

Please add new claims 21-36 as follows:

21. (New) The immunochromatographic specimen defined in Claim 2 wherein, in the case where the sample is blood, the absorption wavelength specific to coloration generated on the specimen is 580 nm or above.

22. (New) The immunochromatographic specimen defined in Claim 2 including a region for holding a substance, which destroys cell components included in the sample.

23. (New) The immunochromatographic specimen defined in Claim 22 wherein the substance which destroys cell components includes inorganic matter, surfactant, or saponins.

24. (New) The immunochromatographic specimen defined in Claim 23 wherein the inorganic matter contains chloride.

25. (New) The immunochromatographic specimen defined in Claim 23 wherein the surfactant contains nonpolar surfactant.

26. (New) The immunochromatographic specimen defined in Claim 2 wherein a coloration degree is qualitatively or quantitatively analyzed with a spectrophotometer.

27. (New) The immunochromatographic specimen defined in Claim 2 wherein the marker includes at least one which is selected from a metal sol, an oxidized metal particle, a non-metal sol, a dye sol, a colored particle, a pigment, or an enzyme.

28. (New) The immunochromatographic specimen defined in Claim 2 wherein the analyte contains at least one of plasma protein, bacteria, and virus.

29. (New) The chromatograph analyzing method defined in Claim 12 wherein, in the case where the sample is blood, a signal from the marker in a coloration region is measured at a wavelength of any 580 nm or above, thereby qualitatively or quantitatively analyzing the analyte.

30. (New) The chromatograph analyzing method defined in Claim 12 wherein the immunochromatographic specimen includes a region where a substance which destroys cell components in the sample is held.

31. (New) The chromatograph analyzing method defined in Claim 30 wherein the substance which destroys cell components includes inorganic matter, surfactant, or saponins.

32. (New) The chromatograph analyzing method defined in Claim 31 wherein the inorganic matter contains chloride.

33. (New) The chromatograph analyzing method defined in Claim 31 wherein the surfactant contains nonpolar surfactant.

34. (New) The chromatograph analyzing method defined in Claim 12 wherein a coloration degree is qualitatively or quantitatively analyzed with a spectrophotometer.

35. (New) The chromatograph analyzing method defined in Claim 12 wherein the marker includes at least one which is selected from a metal sol, an oxidized metal particle, a non-metal sol, a dye sol, a colored particle, a pigment, or an enzyme.

36. (New) The chromatograph analyzing method defined in Claim 12 wherein the analyte contains at least one of plasma protein, bacteria, and virus.
